LAB-03-LOGIC BUILDING

You are provided with a set of numbers (array of numbers).

You have to generate the sum of specific numbers based on its position in the array set provided to you.

This is explained below:

Example 1:

Let us assume the encoded set of numbers given to you is:

input1:5 and input2: {1, 51, 436, 7860, 41236}

Step 1:

Starting from the 0th index of the array pick up digits as per below:

0th index - pick up the units value of the number (in this case is 1).

1st index - pick up the tens value of the number (in this case it is 5).

2nd index - pick up the hundreds value of the number (in this case it is 4).

3rd index - pick up the thousands value of the number (in this case it is 7).

4th index - pick up the ten thousands value of the number (in this case it is 4).

(Continue this for all the elements of the input array).

The array generated from Step 1 will then be - {1, 5, 4, 7, 4}.

Step 2:

Square each number present in the array generated in Step 1.

{1, 25, 16, 49, 16}

Step 3:

Calculate the sum of all elements of the array generated in Step 2 to get the final result. The result will be = 107.

Note:

- 1) While picking up a number in Step1, if you observe that the number is smaller than the required position then use 0.
- 2) In the given function, input1[] is the array of numbers and input2 represents the number of elements in input1.

Example 2:

input1: 5 and input1: {1, 5, 423, 310, 61540}

Step 1:

Generating the new array based on position, we get the below array:

{1, 0, 4, 0, 6}

In this case, the value in input1 at index 1 and 3 is less than the value required to be picked up based on position, so we use a 0.

Step 2:

{1, 0, 16, 0, 36}

Step 3:

The final result = 53.

For example:

Input	Result
5 1 51 436 7860 41236	107
5 1 5 423 310 61540	53

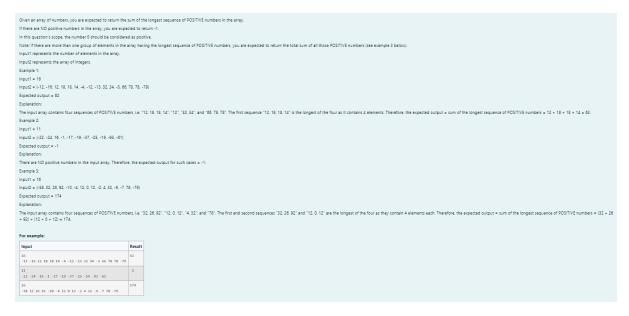

CODE:

import java.util.Scanner;

```
public class ArraySum {
  public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    int n = sc.nextInt();
    int[] input1 = new int[n];
    for (int i = 0; i < n; i++) {
       input1[i] = sc.nextInt();
    }
    int[] newArray = new int[n];
    for (int i = 0; i < n; i++) {
       int number = input1[i];
       int digit = 0;
       if (i == 0) {
         digit = number % 10;
       } else if (i == 1) {
         digit = (number / 10) % 10;
       } else if (i == 2) {
         digit = (number / 100) % 10;
       } else if (i == 3) {
         digit = (number / 1000) % 10;
       } else if (i == 4) {
         digit = (number / 10000) % 10;
       }
```

```
if (number < Math.pow(10, i)) {</pre>
         digit = 0;
      }
      newArray[i] = digit;
    }
    for (int i = 0; i < n; i++) {
      newArray[i] = newArray[i] * newArray[i];
    }
    int sum = 0;
    for (int i = 0; i < n; i++) {
      sum += newArray[i];
    }
    System.out.println(sum);
    sc.close();
  }
}
OUTPUT:
```

	Input	Expected	Got	
~	5 1 51 436 7860 41236	107	107	~
~	5 1 5 423 310 61540	53	53	~
Passeo	d all tests! 🗸			

CODE:

```
